

The following rewritten abstract replaces the abstract as filed in the application.

Amendment to the Abstract:

02 --An examination and treatment chair is operable to move between a generally upright patient entry/exit position and a reclined patient examination and treatment position. The chair includes a seat section and a back section that moves between a generally upright position and a reclined position. Arm rests are rigidly connected to the back section and move with the back section. The arm rests are automatically positioned to allow a patient unobstructed entry into or exit from the chair.--
